AMENDMENTS TO THE SPECIFICATION:

Please amend the paragraph beginning at <u>page 3</u>, <u>line 8</u>, in the specification as follows:

— A particularly desiderable desirable additional characteristic of optical couplers is wavelength tunability, so that the dropped wavelength may be changed, in order to increase the flexibility of networks. The goal of a tuneable coupler is therefore to select one channel (or several channels) in a given incoming input optical signal and transmitting all other channels through the filter, said channel being changeable. —

Please amend the paragraph beginning at <u>page 3</u>, line <u>19</u>, in the specification as follows:

— Silica on its own may be thermo-optically tuned. However its thermo-optic coefficient dn/dT is of the order of 10⁻⁵/ $^{\circ}$ C and a change of temperature of 100 $^{\circ}$ C will typically shift the filter wavelength by less than 1 nm. This may restrict the applications where the desiderable desirable tuning range is of several nm. —

Please amend the paragraph beginning at page 22, line , in the specification as follows:

— Example 5

A coupler designed to work in the erbium C-band (λ_{min} = 1530 nm, λ_{max} = 1565 nm) is considered. The two waveguides are vertically stacked and have a square core. In particular the input lower waveguide 1 has core dimensions 4 μ m x 4 μ m (SiO₂ doped with Ge) and effective index n_{1c} =1. 447, while the output waveguide has core
